Flows & Liquidity

What are the spillovers from private to public assets?

- In principle, the risks posed by private assets to public markets should be modest given that the holders of private assets are typically investors such as SWFs, endowments, pension funds and high net worth individuals with long investment horizons and who intend to hold these assets to maturity.
- However there are circumstances where there could be spillover effects from private assets to public markets particularly in a recession and within private assets these circumstances are more likely to emanate from private equity.
- The recent rebound in US liquidity or money supply should prove temporary.
- While euro area companies appear to have accumulated a rather heavy effective long EUR position, speculative investors such as CTAs have to yet to reach extreme long EUR territory.
- Positions across commodity futures look oversold in Brent oil, neutral in copper and overbought in gold.

- The stock of private assets i.e. private equity, private credit, real estate and hedge funds, continued to grow this year approaching the \$30tr mark (Figure 1). This represents a sizable close to 15% share of the total asset universe of both private and public assets (Figure 2). While private assets continue to attract a large amount of investor capital of above \$1tr each year, fundraising has slowed significantly in recent years as higher interest rates have hit private assets such private equity and real estate. Figure 3 suggests that fundraising for private assets had peaked at \$1.6tr in 2021 and has been slowing steadily since then with the YTD pace of \$1.07tr representing the slowest pace since 2018.

- The question of vulnerabilities in the private equity space was one of the issues that we have touched on in our sister publication Alternative Investments Outlook and Strategy (AIOS). We have noted that rising debt service costs has

created issues for older vintages in particular, where deals were made typically with higher leverage and higher interest costs present a larger drain on cash flows and consequently a larger headwind for payouts to private equity investors. In turn, this has been a factor behind the prolonged period of softness in exit activity, amid a persistent gap between the price that sellers expect to receive and what buyers are prepared to pay, even as fundraising has remained robust. One of the manifestations of this gap is the discount to NAV on publicly listed PE funds (Figure 4). This discount has improved from its lows in 2H22 when it averaged around 25% to 23% in 2023. In 2024, this had improved further from around 20% in 1Q24 and close to 15% in 2Q24. The deterioration in sentiment around risk assets saw it widen again briefly to around 20%, but the recovery in publicly listed markets has also been accompanied by a partial reversal of this deterioration in discount to NAV.

Figure 4: Premium/Discount on LPX Major Market Index of publicly listed private equity

In %. Measured as the premium or discount embedded in the price to book ratio of the LPX index. Dashed line denotes the average discount in 2021, 1H22, 2H22, 2023 and 2024 to-date.

Source: LPX, J.P. Morgan.

- In the event this gap between robust fundraising and weak exits continues there could be spillover effects from private equity to broader markets. If PE investors struggle to meet capital commitments they have made via participating in previous fundraising rounds because cashflows from existing investments prove insufficient, then they could be forced to sell assets in order to meet these commitments. And capital calls by private equity funds for example tend to rise during downturns as the sponsored companies struggle for survival, potentially exacerbating the problem.
- This headwind to payouts to PE investors can also be seen in a rising gap between distribution and capital call rates, shown in Figure 5. It shows the 12-month rolling distribu-

22 August 2024

tions of cash as a percentage of NAV and the 12-month rolling capital calls as a percentage of dry powder, as well as the z-score of the difference between distribution and capital call rates. Capital call rates rose sharply in 2021 and 2022 as PE fund managers sought to increase deal activity, but while they have slowed from their 3Q22 highs capital calls remain at the upper end of their pre-pandemic ranges. At the same time, distribution rates have declined from their 2021 high as exit activity slowed to levels last seen in 2010. As a result, the z-score of the difference between the distribution and capital call rates remains rather depressed the past two decades. Not only has the gap between the two remained depressed, but net cash flows to PE investors have turned negative in notional terms as well as capital calls are outpacing distributions (Figure 6). Another manifestation of this bottleneck in exits is that the share of NAV that has been held for more than 7 years in PE funds has increased from around a quarter in 2021 to around a third in mid-2023 according to Pitchbook data.

Figure 5: Global private equity (PE) distribution and capital call rates

- This negative gap between distributions and capital calls, while perhaps not large in magnitude, nonetheless highlights a vulnerability to negative shocks in the current conjuncture. While broader market sentiment in listed equity and bond markets has improved, after weaker than expected US labor market data had prompted a notable increase in concerns over recession risk, there is an apparent fragility in market sentiment. And in the event recession risks increase or even materialise, this negative gap between distributions and capital calls could worsen. And as we note above, eventually this could force investors to sell public assets to meet these private asset commitments (similar to 2008) or sell private assets in secondary markets. The development and growth in the secondary market in private equity following the financial crisis has been a positive development in this regard as it means there is an alternative route for investors to raise liquidity by offloading private equity stakes. Coupled with publicly listed markets holding up, this likely provides some confidence for PE investors that they will be able to meet capital calls for new commitments.
- There are some signs that the pickup in activity in secondary markets in 2Q24 after a weak 1Q has continued in 3Q thus far (Figure 7). Given that the dry powder of secondary funds stood at around \$235bn in 2H23 according to Pitchbook estimates, this suggests that there is significant space to absorb these sales. In 2H23, a similar increase in the pace of exits vs. a weaker 1H23 was accompanied by an improvement in discounts to NAV on secondary transactions according to Jefferies data. But this improvement was in part flattered by PE investors selling newer vintages to reduce discounts as they sought to raise liquidity to free up capital for new investments. The capacity of secondary markets to absorb stakes when PE investors need

to raise liquidity is clearly a positive, in particular compared to 2008 when the secondary market for private equity was just emerging in response to the bottleneck the financial crisis at the time had inflicted on private equity. But if this tendency to sell recent vintages to raise liquidity to meet commitments in subsequent fundraisings continues, it also underscores this vulnerability arising from the negative gap between distributions and capital calls. In this regard, a pickup in exits would clearly be welcome.

Figure 7: US secondary buyout PE deal activity

\$bn, 3Q24 as of Aug 20th.

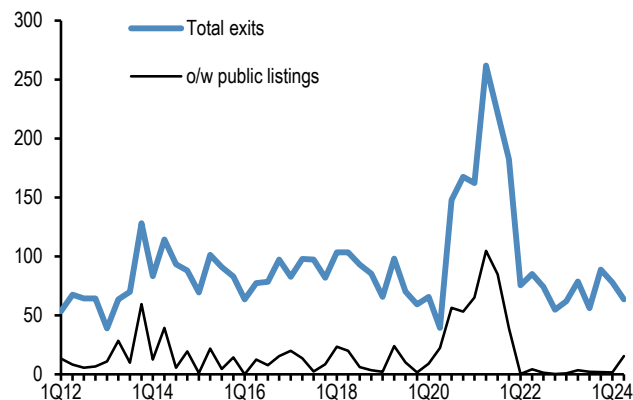

Source: Pitchbook, J.P. Morgan.

- When it comes to exits, however, the picture is rather mixed. On the positive side, the fact US PE saw an uptick in exits via public listings in 2Q24 to \$15bn (Figure 8), almost equalling the combined total of the prior nine quarters since the start of 2022, was clearly positive. At the same time, the total pace of exits of just under \$65bn is below the quarterly average since the start of 2022 of just under \$75bn, as well as below the average pace of exits in the five years preceding the financial crisis of around \$85bn per quarter. This suggests a rather low exit pace when factoring in the growth in the PE universe relative to the pre-pandemic period.

Figure 8: Quarterly US PE exits

In \$bn.

Source: Pitchbook, J.P. Morgan.

- The start of an eventual easing cycle by the Fed should provide some relief as it could signal that after a prolonged period of high interest costs this headwind for older vintages could begin to recede. However, this clearly depends on the catalyst for these rate cuts. If it represents a gradual shift away from tight monetary conditions towards neutral as inflation settles closer to target and growth holds up, this would clearly be positive. If, on the other hand, it represents the start of a cutting cycle amid an economy that approaches contraction, the implications are clearly less benign and the reduced headwind from interest costs would likely be more than offset by a hit to cash flows generated by the underlying companies.
- While the above highlights a vulnerability for private equity, in private credit there are fewer causes for concern. Private credit deals have typically been transacted at higher yields than leveraged loans (Figure 9), giving some cushion to absorb defaults, and the regular interest payments create a steadier stream of cash flows. Indeed, as we note above, there has been some moderation in fundraising, and an improvement in sentiment has seen improved capital market conditions for syndicated loans and seen a recapturing of market share by public markets from private lenders. Indeed, increased competition between private and syndicated markets has seen around \$24bn of syndicated loans refinanced into private credit and around \$23bn of direct loans into syndicated loans YTD. Moreover, default activity in private credit and leveraged loans have been broadly comparable ([JPM High Yield and Leveraged Loans](#), Aug 14th).
- What about real estate? High interest rates remain a headwind for commercial real estate, challenging both valuations and refinancing. Legacy non-transacted private real estate has yet to be revalued properly as we previously explained in our sister publication AIOS. That said, simi-

22 August 2024

lar to private credit, there is steadier stream of cash flows in real estate which combined with some moderation in fundraising reduces the risk of the bottleneck we fear for private equity where investors might be forced to sell public assets to meet capital calls. In all, any spillover effects from private assets to public markets are more likely to emanate from private equity rather than private credit or real estate. That said, rising delinquency rates which are evident in the office space do pose risks to segments of credit markets such as more office-exposed CMBS.

The recent rebound in US liquidity or money supply should prove temporary

- We had argued previously in our publication that the US liquidity or money supply backdrop, i.e. the sum of the stock of US bank deposits and Money Market Funds (MMFs), has likely entered a mildly contracting trend from April onwards. This forecast of mildly contracting trend of US liquidity that we previously envisaged to last until at least year-end reflected three factors: 1) continuation of the Fed's QT till at least year-end even as the QT pace was halved from June onwards; 2) a bottoming out in the usage of the Fed's reverse repo facility by domestic counterparties; and 3) a milder expansion of US bank loans compared to previous years.
- After contracting in April, US liquidity or money supply rebounded in recent months (Figure 10). While this rebound challenges our above forecast for a mildly contracting trend until at least year-end, we believe that our forecast is still reasonable and that the recent rebound in US liquidity is likely to prove temporary. In our mind there have been two recent boosts to US liquidity.
- One temporary boost to US liquidity emanated from the recent decline in the US Treasury General Account (TGA) to below the \$850bn level the US Treasury expects for September-end. As the TGA balance rises from its current level of \$743bn to \$850bn by September-end, this would exert downward pressure on US liquidity.

Figure 10: Stock of US M2 money supply proxied by the sum of the stock of US commercial bank deposits and the AUM of US MMFs

In \$tr.

Source: Bloomberg Finance L.P., J.P. Morgan.

Figure 11: US Treasury General Account (TGA) at the Fed

\$bn.

Source: Bloomberg Finance L.P., J.P. Morgan.

- The second temporary boost emanated from the recent reduction in the Fed's reverse repo facility to below \$300bn in August (Figure 12). In turn this reduction was driven by elevated US Tbill issuance during July and August (Figure 13) that induced US money market funds to shift from reverse repos to Tbills. This force is likely behind us as we expect very little Tbill issuance between now and year-end and we thus look for the Fed's reverse repo facility to stop declining and hover at close to current levels.

Figure 12: Fed's Reverse Repo facility usage by domestic counterparties

Source: Bloomberg Finance L.P., J.P. Morgan.

Figure 13: Monthly change in outstanding T-bills

Source: Federal Reserve, J.P. Morgan.

- With these two temporary boosts likely behind us, the Fed's ongoing QT and a milder expansion of US bank loans (Figure 14) should all combine to create a contracting trajectory for US liquidity or money supply into year end. And this would represent a big change from the past year and in particular the 11-month period between the end of April 2023 and the end of March 2024, when US money supply had expanded by \$1.3tr, largely as the result of the liquidity injection induced by the \$1.8tr reduction in the Fed's reverse repo facility. Over the past few years, we can thus detect three phases in the trajectory for US liquidity or money supply: a mildly contracting phase from the beginning of 2022 to April 2023, a rapidly expanding phase from the end of April 2023 to the end of March 2024 and a return to a mildly contracting phase from April this year onwards.

While euro area companies appear to have accumulated a rather heavy effective long EUR position, speculative investors such as CTAs have to yet to reach extreme long EUR territory

- With expectations on Fed rate cuts intensifying on US recession fears the dollar has come under pressure in particular against the euro given a backdrop of more resilient euro area growth. With the euro breaking out above 1.11, a level which over the past year and a half had triggered mean reversion, a question arises about the current extremity of short dollar/long euro positions.
- Starting first with currency only hedge funds, they appear to have started the year with a long dollar stance during January as suggested by the positive beta between the monthly HFRI Currency HF index and the JPM USD tradeable index. According to Figure 15 this positive beta was also present until May but appears to have got unwound during June and July. In other words, currency hedge funds appear to have entered August rather neutral on the dollar.

22 August 2024

Figure 15: Currency HF and USD returns

Monthly returns of the HFRI Currency HF index and the JPM USD tradable index.

Source: HFR, Bloomberg Finance L.P., J.P. Morgan.

- That said, the speculative position indicator based on the non-commercial category of CFTC data which includes a broader set of macro managers beyond currency only hedge funds, had pointed to a modest long dollar base at the end of July (Figure 16). Surely some of that previous long dollar base in Figure 16 was due to systematic funds such as CTAs. In particular, the signals from our momentum-based framework (see Tables A3 and A4 in the Appendix) that we regularly use to proxy positioning by momentum traders such as CTAs, pointed to much heavier yen shorts relative to euro shorts at the end of July (Figure 17). While these previous extreme short yen positions by systematic funds swung from extremely short to extremely long territory and then back down to neutral over the past three weeks, previous euro shorts have seen more orderly unwinding shifting from modestly short territory at the end of July to modestly long territory currently. So in our framework, momentum traders such as CTAs have yet to reach extreme long positions in the euro.

- What about corporates? Corporate hedging behavior can also be important for currency moves as corporates come under pressure to boost their hedges when currency fluctuations increase. What evidence do we have on corporate hedging behavior? Gauging corporate hedging behavior or their currency exposure is a difficult task given that corporates face multiple currency influences both in terms of cash flow and balance sheet items. In addition, their reporting on hedges is rather sporadic, lagged and incomplete. To overcome this difficulty, we apply a framework first presented in Gauging corporate fx hedging, Sep 2017, that draws on the academic literature that has devised indirect ways to gauge corporates' currency exposures via measuring the sensitivity of equity values to for-

eign exchange changes.

- We follow the extensive academic literature built on the original paper by Adler and Dumas (“Exposure to Currency Risk” 1984) and we proxy the currency exposure of corporates via the following bivariate regression at the individual firm level:

- $R_{i,t} = a + c_i \times RM_{i,t} + b_i \times \Delta FX_{i,t} + \text{residual}.$

- where $R_{i,t}$ is the return on the equity value of the firm i for the period $t-1$ to t , $RM_{i,t}$ is the return on the market portfolio proxied by a country’s equity index in local currency terms, c_i is the firm’s market beta, $\Delta FX_{i,t}$ is the change in the relevant trade weighted exchange rate for the period $t-1$ to t and b_i is the firm’s exchange rate beta.
- This exchange rate beta coefficient is used as proxy for each firm’s net currency exposure. It effectively reflects the change in each firm’s value that can be explained by movements in the exchange rate after conditioning on the market return. Most empirical academic studies follow the above specification, i.e. they include the return to a market portfolio along with the exchange rate variable in their regression models. The market portfolio return not only controls for “macro” influences on a firm’s value outside the exchange rate, but also improves the precision of the regression coefficient estimates as the residual variance of the model is dramatically reduced.
- We apply this framework to both euro area large cap companies, i.e. the 50 companies behind the Eurostoxx50 index, and small cap companies, i.e. the 50 biggest companies behind the Eurostoxx Small Cap index. Figure 18 shows these average betas, i.e. the average of the bivariate regression coefficients across 50 individual firm regression models for Eurostoxx50 and for 50 small-cap companies. The regressions are done over 6-month rolling periods and are based on weekly equity returns and currency changes of the JPM euro trade weighted index. Given the 6-month rolling periods the betas tend to be more backward looking and as a result more difficult to interpret. That said, the abrupt increases in Figure 18 do suggest that Euro area companies had accumulated a rather heavy effective long euro position, perhaps due to importers’ reluctance to hedge their structural long euro position or due to exporters overhedging their structural short euro position.

Figure 18: Average beta of Eurostoxx 50 companies and Eurostoxx Mid-Cap to trade-weighted EUR

Rolling 26 weeks average betas based on a bivariate regression of the weekly returns of individual stocks in the Eurostoxx 50 index to the weekly returns of the MSCI AC World and JPM EUR Nominal broad effective exchange rate (NEER).

Speculative investors’ positions across commodity futures look oversold in Brent oil, neutral in copper and overbought in gold

- With Brent oil prices about to breach this year’s low, how oversold are oil positions? As we argued previously the mean of net long positions in Brent futures by the managed money category appears to have experienced a structural shift post the pandemic, as the supply of net short positions by the “producer/user” category has been reduced. After taking this structural break into account, we find that discretionary spec investors have exhibited marked OVs in oil futures in September 2023 and early April 2024 but have shifted in the opposite direction in recent weeks shifting to historically very oversold levels (Figure 19).

22 August 2024

% of open interest. Dashed line shows average for 2015-2019 and 2020 onward.

Source: CFTC, Bloomberg Finance L.P., J.P. Morgan.

- What about other commodities? For copper futures, whether one looks at the speculative/managed money positions (Figure 20) or our momentum signals as a proxy of how momentum traders such as CTAs are positioned (Figure 21), positions look close to neutral. For gold futures whether one looks at the speculative/managed money positions (Figure 22) or our momentum signals as a proxy of how momentum traders such as CTAs are positioned (Figure 23), positions look rather overbought.

Note: Swaps volatility is 3m 10y payer ATM implied annualized BP vol and credit volatility is 3m 5y on-the-run ATM spread volatility. MSCI EM, Gold, Oil, Copper, BB Commodity Index and Treasury futures are 3m implied vol from Bloomberg.

Definitions:

| | |
|------------------------------|---|
| Current: | Latest available closing level (19-Aug-24) |
| Low: | Lowest closing level in the last 1y |
| Low date: | Date the lowest closing level was reached (or the first time it was reached in the case of several identical low closing levels) |
| High: | Highest closing level in the last 1y |
| High date: | Date the highest closing level was reached (or the first time it was reached in the case of several identical high closing levels) |
| Graph: | Shows the current level and the 25th/75th percentile relative to the 1y high/low |
| Upside: | Implied return/volatility percentage points from current level up to the High (note: return is calculated as simple difference for spread products) |
| Upside (σ): | Upside in terms of standard deviations (Upside / Current 1y realized volatility) |
| Downside: | Implied return/volatility percentage points from current level down to the Low (note: return calculated as simple difference for spread products) |
| Downside (σ): | Downside in terms of standard deviations (Downside / Current 1y realized volatility) |
| Implied/realized volatility: | Current 3m implied volatility / current realized 3m volatility |

Chart A11b: Option skew monitor

Skew is the difference between the implied volatility of out-of-the-money (OTM) call options and put options. A positive skew implies more demand for calls than puts and a negative skew, higher demand for puts than calls. It can therefore be seen as an indicator of risk perception in that a highly negative skew inequities is indicative of a bearish view. The chart shows z-score of the skew, i.e. the skew minus a rolling 2-year avg skew divided by a rolling two-year standard deviation of the skew. A negative skew on iTraxx Main means investors favour buying protection, i.e. a short risk position. A positive skew for the Bund reflects a long duration view, also a short risk position.

Chart A11c: Equity-Bond metric map

Explanation of Equity - Bond metric map: Each of the five axes corresponds to a key indicator for markets. The position of the blue line on each axis shows how far the current observation is from the extremes at either end of the scale. For example, a reading at the centre for value would mean that risky assets are the most expensive they have ever been while a reading at the other end of the axis would mean they are the cheapest they have ever been. Overall, the larger the blue area within the pentagon, the better for the risky markets. All variables are expressed as the percentile of the distribution that the observation falls into. I.e. a reading in the middle of the axis means that the observation falls exactly at the median of all historical observations. **Value:** The slope of the risk-return trade-off line calculated across USTs, US HG and HY corporate bonds and US equities(see GMOS p. 6, Loeys et al, Jul 6 2011 for more details). **Positions:** Difference between net spec positions on US equities and intermediate sector UST. See Chart A13. **Flow momentum:** The difference between flows into equity funds (incl. ETFs) and flows into bond funds. Chart A1. We then smooth this using a Hodrick-Prescott filter with a lambda parameter of 100. We then take the weekly change in this smoothed series as shown in Chart A1. **Economic momentum:** The 2-month change in the global manufacturing PMI. (See REVISITING: Using the Global PMI as trading signal, Nikolaos Panigirtzoglou, Jan 2012). **Equity price momentum:** The 6-month change in the S&P500 equity index. As of 16th Aug 24.

Spec position monitor

Chart A12: Weekly Spec Position Monitor

Net spec positions are proxied by the number of long contracts minus the number of short contracts using the speculative category of the Commitments of Traders reports (as reported by CFTC). To proxy for speculative investors for equity and US Treasury bond futures positions we use Asset managers and leveraged funds (see Chart A13), whereas for other assets we use the legacy Non-Commercial category. This net position is then converted to a dollar amount by multiplying by the contract size and then the corresponding futures price. We then scale the net positions by open interest. The chart shows the z-score of these net positions. US rates is a duration-weighted composite of the individual UST futures contracts excluding the Eurodollar contract.

Source: Bloomberg Finance L.P., CFTC, J.P. Morgan

Chart A13: Positions in US equity futures by Asset managers and Leveraged funds

CFTC positions in US equity futures by Leveraged funds and Asset managers (as a % of open interest). It is an aggregate of the S&P500, DowJones, NASDAQ and their Mini futures contracts.

Source: CFTC, Bloomberg Finance L.P. and J.P. Morgan

Chart A14: Spec position indicator on Risky vs. Safe currencies

Difference between net spec positions on risky & safe currencies. Net spec position is calculated in USD across 5 'risky' and 3 'safe' currencies (safe currencies also include Gold). These positions are then scaled by open interest and we take an average of 'risky' and 'safe' assets to create two series. The chart is then simply the difference between the 'risky' and 'safe' series. The final series shown in the chart below is demeaned using data since 2006. The risky currencies are: AUD, NZD, CAD, MXN and BRL. The safe currencies are: JPY, CHF and Gold.

Source: Bloomberg Finance L.P., CFTC, J.P. Morgan.

Chart A15: Spec position indicator on US equity futures vs. intermediate sector UST futures

Difference between net spec positions on US equity futures vs. intermediate sector UST futures. This indicator is derived by the difference between total CFTC positions in US equity futures by Asset managers + Leveraged Funds scaled by open interest minus the Asset managers + Leveraged Funds spec position on intermediate sector UST futures (i.e. all UST futures duration weighted ex ED and ex 2Y UST futures) also scaled by open interest.

Chart A19: Momentum signals for 10Y UST and 10Y Bunds

Average z-score of Short- and Long-term momentum signal in our Trend Following Strategy framework shown in Tables A3 and A4 below in the Appendix

Source: Bloomberg Finance L.P., J.P. Morgan.

22 August 2024

Chart A20: Momentum signals for S&P500

Average z-score of Short- and Long-term momentum signal in our Trend Following Strategy framework shown in Tables A3 and A4 below in the Appendix.

Source: Bloomberg Finance L.P., J.P. Morgan.

Chart A21: Equity beta of US Balanced Mutual funds and Risk Parity funds

Rolling 21-day equity beta based on a bivariate regression of the daily returns of our Balanced Mutual fund and Risk Parity fund return indices to the daily returns of the S&P 500 and BarCap US Agg indices. Given that these funds invest in both equities and bonds we believe that the bivariate regression will be more suitable for these funds. Our risk parity index consists of 25 daily reporting Risk Parity funds. Our Balanced Mutual fund index includes the top 20 US-based active funds by assets and that have existed since 2006. Our Balanced Mutual fund index has a total AUM of \$700bn, which is around half of the total AUM of \$1.5tr of US based Balanced funds which we believe to be a good proxy of the overall industry. It excludes tracker funds and funds with a low tracking error. Dotted lines are average since 2015.

Source: Bloomberg Finance L.P., J.P. Morgan.

Chart A22: Equity beta of monthly reporting Equity Long/Short hedge funds

Proxied by the ratio of the monthly performance of Pivotal Path Asset-Weighted Equity Hedge fund index divided by the monthly performance of MSCI ACWorld Index.

Source: Bloomberg Finance L.P., Pivotal Path, J.P. Morgan

Chart A23: USD exposure of currency hedge funds

The net spec position in the USD as reported by the CFTC. Spec is the non-commercial category from the CFTC.

Source: CFTC, Barclay, Datastream, Bloomberg Finance L.P., J.P. Morgan.

CTAs – Trend following investors' momentum indicators

Table A3: Simple return momentum trading rules across various commodities

Optimal look-back period of each momentum strategy combined with a mean reversion indicator that turns signal neutral when momentum z-score more than 1.5 standard deviations above or below mean, and a filter that turns neutral when the z-score is low (below 0.05 and above -0.05) to avoid excessive trading. Look-backs, current signals and z-scores are shown for shorter-term and longer-term momentum separately, along with performance of a combined signal. Annualised return, volatility and information ratio of the signal; current signal; and z-score of the current return over the relevant look-back period; data from 1999 onward.

| | | Lookback (moving avg, days) | Annualized return (%) | Vol (%) | IR | Current signal | Time since last change (days) | Z-score | % Change of return index from its moving average |

Analyst Certification: The Research Analyst(s) denoted by an “AC” on the cover of this report certifies (or, where multiple Research Analysts are primarily responsible for this report, the Research Analyst denoted by an “AC” on the cover or within the document individually certifies, with respect to each security or issuer that the Research Analyst covers in this research) that: (1) all of the views expressed in this report accurately reflect the Research Analyst’s personal views about any and all of the subject securities or issuers; and (2) no part of any of the Research Analyst’s compensation was, is, or will be directly or indirectly related to the specific recommendations or views expressed by the Research Analyst(s) in this report. For all Korea-based Research Analysts listed on the front cover, if applicable, they also certify, as per KOFIA requirements, that the Research Analyst’s analysis was made in good faith and that the views reflect the Research Analyst’s own opinion, without undue influence or intervention.

All authors named within this report are Research Analysts who produce independent research unless otherwise specified. In Europe, Sector Specialists (Sales and Trading) may be shown on this report as contacts but are not authors of the report or part of the Research Department.

Important Disclosures

An analyst listed on the front cover has personal holdings in digital or crypto assets.

Company-Specific Disclosures: Important disclosures, including price charts and credit opinion history tables, are available for compendium reports and all J.P. Morgan–covered companies, and certain non-covered companies, by visiting <https://www.jpmm.com/research/disclosures>, calling 1-800-477-0406, or e-mailing research.disclosure.inquiries@jpmorgan.com with your request.

Explanation of Equity Research Ratings, Designations and Analyst(s) Coverage Universe:

J.P. Morgan uses the following rating system: Overweight (over the duration of the price target indicated in this report, we expect this stock will outperform the average total return of the stocks in the Research Analyst’s, or the Research Analyst’s team’s, coverage universe); Neutral (over the duration of the price target indicated in this report, we expect this stock will perform in line with the average total return of the stocks in the Research Analyst’s, or the Research Analyst’s team’s, coverage universe); and Underweight (over the duration of the price target indicated in this report, we expect this stock will underperform the average total return of the stocks in the Research Analyst’s, or the Research Analyst’s team’s, coverage universe. NR is Not Rated. In this case, J.P. Morgan has removed the rating and, if applicable, the price target, for this stock because of either a lack of a sufficient fundamental basis or for legal, regulatory or policy reasons. The previous rating and, if applicable, the price target, no longer should be relied upon. An NR designation is not a recommendation or a rating. In our Asia (ex-Australia and ex-India) and U.K. small- and mid-cap Equity Research, each stock’s expected total return is compared to the expected total return of a benchmark country market index, not to those Research Analysts’ coverage universe. If it does not appear in the Important Disclosures section of this report, the certifying Research Analyst’s coverage universe can be found on J.P. Morgan’s Research website, <https://www.jpmorganmarkets.com>.

J.P. Morgan Equity Research Ratings Distribution, as of July 06, 2024

| | Overweight (buy) | Neutral (hold) | Underweight (sell) |
|--|---------------------|-------------------|-----------------------|
| J.P. Morgan Global Equity Research Coverage* | 49% | 38% | 13% |
| IB clients** | 49% | 46% | 34% |
| JPMS Equity Research Coverage* | 48% | 41% | 11% |
| IB clients** | 69% | 66% | 50% |

*Please note that the percentages may not add to 100% because of rounding.

**Percentage of subject companies within each of the "buy," "hold" and "sell" categories for which J.P. Morgan has provided investment banking services within the previous 12 months.

For purposes of FINRA ratings distribution rules only, our Overweight rating falls into a buy rating category; our Neutral rating falls into a hold rating category; and our Underweight rating falls into a sell rating category. Please note that stocks with an NR designation are not included in the table above. This information is current as of the end of the most recent calendar quarter.

Equity Valuation and Risks: For valuation methodology and risks associated with covered companies or price targets for covered companies, please see the most recent company-specific research report at <http://www.jpmorganmarkets.com>, contact the primary analyst or your J.P. Morgan representative, or email research.disclosure.inquiries@jpmorgan.com. For material information about the proprietary models used, please see the Summary of Financials in company-specific research reports and the Company Tearsheets, which are available to download on the company pages of our client website, <http://www.jpmorganmarkets.com>. This report also sets out within it the material underlying assumptions used.

A history of J.P. Morgan investment recommendations disseminated during the preceding 12 months can be accessed on the Research & Commentary page of <http://www.jpmorganmarkets.com> where you can also search by analyst name, sector or financial instrument.

Analysts' Compensation: The research analysts responsible for the preparation of this report receive compensation based upon various factors, including the quality and accuracy of research, client feedback, competitive factors, and overall firm revenues.

Registration of non-US Analysts: Unless otherwise noted, the non-US analysts listed on the front of this report are employees of non-US affiliates of J.P. Morgan Securities LLC, may not be registered as research analysts under FINRA rules, may not be associated persons of J.P.

Morgan Securities LLC, and may not be subject to FINRA Rule 2241 or 2242 restrictions on communications with covered companies, public appearances, and trading securities held by a research analyst account.

Other Disclosures

J.P. Morgan is a marketing name for investment banking businesses of JPMorgan Chase & Co. and its subsidiaries and affiliates worldwide.

UK MIFID FICC research unbundling exemption: UK clients should refer to [UK MIFID Research Unbundling exemption](#) for details of J.P. Morgan's implementation of the FICC research exemption and guidance on relevant FICC research categorisation.

All research material made available to clients are simultaneously available on our client website, J.P. Morgan Markets, unless specifically permitted by relevant laws. Not all research content is redistributed, e-mailed or made available to third-party aggregators. For all research material available on a particular stock, please contact your sales representative.

These discrepancies should not impact the overall investment analysis, views and/or recommendations of the subject company(ies) that may be discussed in the material. J.P. Morgan accepts no liability whatsoever for any loss arising from any use of this material or its contents, and neither J.P. Morgan nor any of its respective directors, officers or employees, shall be in any way responsible for the contents hereof, apart from the liabilities and responsibilities that may be imposed on them by the relevant regulatory authority in the jurisdiction in question, or the regulatory regime thereunder. Opinions, forecasts or projections contained in this material represent J.P. Morgan's current opinions or judgment as of the date of the material only and are therefore subject to change without notice. Periodic updates may be provided on companies/industries based on company-specific developments or announcements, market conditions or any other publicly available information. There can be no assurance that future results or events will be consistent with any such opinions, forecasts or projections, which represent only one possible outcome. Furthermore, such opinions, forecasts or projections are subject to certain risks, uncertainties and assumptions that have not been verified, and future actual results or events could differ materially. The value of, or income from, any investments referred to in this material may fluctuate and/or be affected by changes in exchange rates. All pricing is indicative as of the close of market for the securities discussed, unless otherwise stated. Past performance is not indicative of future results. Accordingly, investors may receive back less than originally invested. This material is not intended as an offer or solicitation for the purchase or sale of any financial instrument. The opinions and recommendations herein do not take into account individual client circumstances, objectives, or needs and are not intended as recommendations of particular securities, financial instruments or strategies to particular clients. This material may include views on structured securities, options, futures and other derivatives. These are complex instruments, may involve a high degree of risk and may be appropriate investments only for sophisticated investors who are capable of understanding and assuming the risks involved. The recipients of this material must make their own independent decisions regarding any securities or financial instruments mentioned herein and should seek advice from such independent financial, legal, tax or other adviser as they deem necessary. J.P. Morgan may trade as a principal on the basis of the Research Analysts' views and research, and it may also engage in transactions for its own account or for its clients' accounts in a manner inconsistent with the views taken in this material, and J.P. Morgan is under no obligation to ensure that such other communication is brought to the attention of any recipient of this material. Others within J.P. Morgan, including Strategists, Sales staff and other Research Analysts, may take views that are inconsistent with those taken in this material. Employees of J.P. Morgan not involved in the preparation of this material may have investments in the securities (or derivatives of such securities) mentioned in this material and may trade them in ways different from those discussed in this material. This material is not an advertisement for or marketing of any issuer, its products or services, or its securities in any jurisdiction.
